Total Minimum Cost = $(15 \times 4) + (35 \times 1) + (20 \times 3) + (20 \times 8) + (60 \times 2)$
= 555

Proposed Algorithm:

- Check whether the given transportation problem is balanced or not. If not, make it balance by adding dummy row or column.
- Find the range for each row and each column. Then calculate the maximum value among that.
- Allocate the minimum supply or demand at the place of minimum value of the related row or column.
